Professional Summary

Senior Software Engineer with 6+ years of experience building distributed systems in C#/.NET and TypeScript. Architected the deployment, plugin, telemetry, and ingestion infrastructure for Microsoft's incident management platform, driving migrations for 100+ engineers across 4 organizations from design to rollout.

Work Experience

Microsoft

Senior Software Engineer

Redmond, WA/Remote

March 2025 – Present

- Architected a deployment platform for 16 React microfrontends across 12 public, sovereign, and air-gapped environments, taking releases from 1/week to 10/day. Runs active/active inside and outside Azure with 0 downtime auto-failover, plus URL shareable sideloads of any build to any environment.
- Defined the telemetry standard 50+ Azure teams use to structure their information architecture, then built a visualization layer rendering customer engagement metrics beside each auto-instrumented UI component. Used by 1K+ engineers, product managers, and designers, and reviewed daily by Microsoft's C-suite.
- Built a federated, sandboxed plugin platform with automatic monitoring instrumentation, hosting 6 production plugins built by 4 partner organizations and cutting onboarding from weeks to 5 minutes.
- Redesigned CI/CD for a monorepo shared by 100+ engineers, applying job sharding and build caching to cut build time by 79% (120 to 25 minutes) and weekly pipeline time from 400 to 83 hours.
- Rearchitected ingestion from Cosmos DB to Azure Data Explorer, replacing a custom 5 resource pipeline with a native Data Share integration and cutting failure modes, on-call burden, and cloud spend.

Software Engineer II

December 2021 – March 2025

- Led and mentored 5 engineers migrating the platform's most used page (65K DAU) from AngularJS to React, cutting load time from 6 to 1.5 seconds and raising monthly internal CSAT from 3.62 to 4.10 out of 5. Generalized the work into React standards, a layered architecture, and automated scaffolding, mentoring 15 more engineers on 3 other teams as adoption grew from 4 teams to 9.
- Led frontend delivery for an AI copilot as tech lead, from inception to private preview in 2 months, mentoring a junior engineer and integrating it into every portal page across 6 teams in 4 organizations.
- Directed the Cypress to Playwright migration of 418 end to end tests across 11 applications, 5 teams, and 3 organizations for a 7x speedup, adding accessibility checks that replaced quarterly 3rd party audits.
- Designed and shipped the product's first ASP.NET Core microservice on Azure App Service, with RESTful APIs backed by Cosmos DB, separating postmortem workflows from incident and root cause domains.

Software Engineer I

February 2020 – December 2021

- Designed a single sign on token exchange that converts the Microsoft Teams Azure AD token into an internal JWT, letting the embedded Teams app call backend APIs directly and removing a proxy service.
- Built the platform's first React microfrontend by migrating a 13 page KnockoutJS app with 2 engineers, writing 70% of the code and creating the React/TypeScript infrastructure behind all 16 portal applications.

Bloomberg L.P.

Software Engineer Intern

New York, NY

May 2019 – August 2019

- Replaced vendor newsletter rendering on Bloomberg.com with a TypeScript microfrontend backed by a Redis and MySQL service serving compiled HTML, JavaScript, and CSS at up to 75K requests/second.

Skills

Languages & Backend: C#/.NET | ASP.NET Core | TypeScript/Node.js | Java | SQL/KQL | OData/REST
Cloud & Data: Cosmos DB | Azure Data Explorer (Kusto) | Redis | Kafka | Docker | SQL Server | MySQL
Frontend & Testing: React | Angular | Nx | Module Federation | Webpack | Jest | Playwright

Education

Purdue University

(B.S.) Computer Science – GPA: 3.79

West Lafayette, IN

August 2016 – December 2019
