

Ashwin Gokhale

Senior Full-Stack Software Engineer | Backend, Cloud & Platform Engineering

New York City | Remote | [925-548-6767](tel:925-548-6767) | ashwin.gokhale98@gmail.com | [LinkedIn](#)

Summary

- Senior full-stack engineer with 6+ years at Microsoft and 6 years of production C#/.NET experience, targeting backend and distributed-systems roles; built services and web platforms handling 2M requests/day.
- Architected cloud, deployment, and observability platforms used by 100+ Azure teams; increased deployment cadence from 1/week to 1/hour and reduced feature validation from 7 days to 30 minutes.

Technical Skills

Languages: C#/.NET (6 years), TypeScript/Node.js (4 years), SQL/KQL (4 years), Java, Python

Cloud & Backend: Azure, ASP.NET Core, .NET Framework, Cosmos DB, Azure Data Explorer (Kusto), Redis, Kafka, Docker, MySQL

Architecture & Delivery: Distributed systems, microservices, REST APIs, CI/CD, telemetry, monorepos, microfrontends

Frontend & Testing: React, AngularJS, Nx, Module Federation, Playwright, Cypress, Jest, Fluent UI

Professional Experience

Microsoft – Azure Incident Management Platform

Senior Software Engineer

Redmond, WA / Remote

March 2025 – Present

- Re-architected a coupled frontend/backend release model into a runtime-composed platform for 16 independently deployed React applications in an Nx monorepo. Designed active-active hosting on Azure Front Door and Blob Storage with immutable versioning, staged rollouts, rollback safeguards, and runtime failover across Azure-only, sovereign, and isolated cloud environments, increasing deployment frequency from 1/week to 1/hour.
- Built Node.js deployment tooling with URL-shareable version overrides for loading local or pipeline builds against production authentication and data. Reduced validation from 7 days to 30 minutes for 100+ engineers across 7 teams while supporting an ASP.NET host serving 2M requests/day.
- Led architecture and delivery of a self-service telemetry platform adopted by 100+ teams across Azure. Standardized backward-compatible, type-safe instrumentation, reduced onboarding to 10 lines of code, and enabled Azure Data Explorer analysis used daily by senior leaders and engineering stakeholders.
- Led a technical evaluation of the Azure Portal framework, building a prototype and defining a conditional adoption strategy based on product architecture and integration constraints. Translated the findings into an Azure-wide decision tree for an engineering organization of 75,000 engineers.
- Re-architected CI and test infrastructure for a monorepo used by 100+ engineers, cutting pull-request pipelines by 63% (120 to 45 minutes), container startup by 87%, and test execution by 66%, saving 450 engineer-minutes/week.
- Retired 30% of the legacy page surface and the outage application, leading cross-team Angular-to-React migrations and mentoring engineers on shared architecture, code quality, and modern React patterns.

- Led and mentored a 5-engineer team through modernization of the product's most-used page (65K DAU, 600K page views/day) from AngularJS to React, reducing load time by 73% and runtime errors by 27% while increasing customer satisfaction by 96%.
- Designed and shipped the product's first standalone ASP.NET Core service for post-incident reviews, defining RESTful CRUD APIs and separating review workflows from incident and root-cause domains. Rebuilt authentication from the .NET Framework implementation and established an architectural path for future services.
- Delivered the frontend for an AI copilot from inception to private preview in 2 months. Coordinated changes spanning every portal page across 6 teams in 4 organizations with no reported regressions during rollout.
- Directed the migration of 418 end-to-end tests across 11 applications and 5 teams from Cypress to Playwright within one milestone, achieving a 7x speedup and adding automated accessibility checks to every application.
- Built single-command generators and layered-architecture guardrails adopted by 6 libraries across 9 React apps, saving 8 setup hours/library. Created training and documentation that onboarded 3 scrum teams, enabling developers to contribute within 1–2 days.
- Designed Azure AD/JWT authentication using an internal single sign-on token exchange for a Microsoft Teams integration, eliminating an entire proxy service and enabling direct access to REST/OData APIs from the Teams application.

Software Engineer I

February 2020 – March 2021

- Built the incident platform's first React microfrontend and reusable React/TypeScript infrastructure, establishing a reproducible model for independently deployed applications alongside the legacy AngularJS and Angular portal.
- Migrated two internal web platforms to Microsoft's standardized CI/CD system, eliminating self-managed Linux build machines and establishing faster, policy-compliant build pipelines.

Bloomberg L.P.

Software Engineer Intern

New York, NY

May 2019 – August 2019

- Migrated newsletter rendering from a third-party vendor to a TypeScript microfrontend container used to dynamically render client-side modules on Bloomberg.com.
- Built a TypeScript, Redis, and MySQL service to deliver compiled HTML, JavaScript, and CSS templates at up to 75,000 requests per second.

JPMorgan Chase & Co.

Software Engineer Intern

Chicago, IL

June 2018 – August 2018

- Architected an extensible Java and TypeScript test-automation framework for a corporate banking payment platform, automating manual release validation. Served as Scrum Master for a 4-engineer intern team.

Object Edge

Software Engineer Intern

Walnut Creek, CA

May 2017 – August 2017

- Engineered a Java, Kafka, Redis, and Docker customer-intent service handling 5,000 queries per second, and delivered React and GraphQL improvements that resolved 30% of known portal defects.

Additional Experience

Purdue University

Teaching Assistant, Software Engineering

West Lafayette, IN

August 2018 – May 2019

- Taught Scrum and software architecture, evaluated projects, and led weekly sessions on programming and problem-solving for undergraduate engineering teams.

Education

Purdue University

Bachelor of Science in Computer Science, GPA: 3.79

West Lafayette, IN

December 2019
