

Ashwin Gokhale

Senior Software Engineer | Cloud, Platform & Full Stack Systems

New York City | Remote | [925-548-6767](tel:925-548-6767) | ashwin.gokhale98@gmail.com | [LinkedIn](#)

Professional Summary

Senior Software Engineer with 6+ years at Microsoft building production C#/.NET and TypeScript systems across distributed backend services, Azure cloud platforms, and developer infrastructure. Architected the deployment, plugin, and telemetry platforms behind Azure's incident management portal, supporting an ASP.NET host serving 2M requests/day and 50+ engineering teams.

Technical Skills

Languages: C#/.NET, TypeScript/Node.js, SQL/KQL, Java

Cloud & Backend: Azure, ASP.NET Core, .NET Framework, Cosmos DB, Azure Data Explorer (Kusto), Redis, Kafka, Docker, SQL Server, MySQL

Architecture & Delivery: Distributed systems, microservices, REST APIs, CI/CD, telemetry, monorepos, microfrontends

Frontend & Testing: React, AngularJS, Nx, Module Federation, Playwright, Cypress, Jest, Fluent UI

Professional Experience

Microsoft – Azure Incident Management Platform

Senior Software Engineer

Redmond, WA / Remote

March 2025 – Present

- Decoupled frontend releases from backend deployments for 16 React applications in an Nx monorepo, cutting the wait for a test environment release from as long as 2 weeks to hourly on demand deployments while supporting weekly production releases. Designed runtime composition and active/active Azure Front Door and Blob Storage hosting across public, sovereign, and air-gapped clouds, with immutable versioning, staged rollouts, rollback safeguards, and automatic health probe driven failover to infrastructure outside Azure during Azure outages.
- Architected a federated, sandboxed plugin platform serving 6 production plugins owned by the Azure, Identity, and Microsoft 365 organizations. Isolated plugin failures from the host page, eliminated host redeployments for plugin changes, and reduced partner onboarding from an inner source contribution and deployment cycle to a 5 minute configuration change.
- Rearchitected incident metadata ingestion from Cosmos DB to Azure Data Explorer, replacing a 5 resource custom pipeline (Azure Function, Event Hub, managed identity, Azure Monitor, and Application Insights) with native Cosmos DB Data Share. Reduced sync latency from 6 minutes to 5 minutes and eliminated the pipeline's failure modes, on-call burden, and recurring Azure spend.
- Owned Node.js deployment tooling with shareable URL version overrides for loading local or pipeline builds against production authentication and data. Reduced validation from 7 days to 30 minutes for 100+ engineers across 7 teams while supporting an ASP.NET host serving 2M requests/day.
- Architected a telemetry platform that automatically instruments and logs customer engagement for 50+ engineering teams across ICM and partner organizations, with teams opting in through 10 lines of config to visualize their own data. Built embedded visualizations used by 2,000+ engineers and daily by L1/L2 leadership and Azure CXP stakeholders.
- Redesigned CI for a monorepo used by 100+ engineers, introducing job sharding, dependency and Nx task caching, slimmer container images, package upgrades, and test optimization to cut pull request pipeline time 75%, from 120 to 30 minutes.
- Led a 20 page Angular 2+ to React migration, personally rewriting 5 pages and coordinating 5 partner teams. Deprecated 600K lines of legacy code, reduced frontend error rate 25%, from 500 to 375 errors per day, and achieved WCAG 2.1 Level AA conformance.

Microsoft – Azure Incident Management Platform (continued)
Software Engineer II

Redmond, WA / Remote
December 2021 – March 2025

- Designed and shipped the product's first standalone ASP.NET Core service for post incident reviews, defining RESTful CRUD APIs and separating review workflows from incident and root cause domains. Rebuilt authentication from a legacy .NET Framework implementation and established an architectural path for future services.
- Led and mentored a team of 5 engineers that migrated the incident platform's most used page (65K DAU, 600K page views/day) from AngularJS (1.x) to React, reducing load time from 6 seconds to 1.5 seconds and runtime errors 27% while raising the monthly internal CSAT score 56%, from 52 to 81.
- Owned frontend delivery for an AI copilot from inception to private preview in 2 months. Coordinated changes spanning every portal page across 6 teams in 4 organizations with no regressions during rollout.
- Directed a migration of 418 end to end tests across 11 applications, 5 teams, and 3 organizations from Cypress to Playwright within one milestone, achieving a 7x speedup that saved 8 hours of pull request build time each day. Embedded automated accessibility checks in every application, eliminating two weeks of manual audits by a vendor team each quarter.
- Established the incident platform's React engineering standards and layered architecture used by 30 engineers across 4 teams to migrate its 4 most used pages from AngularJS (1.x). Automated React application and shared library creation with one command; led training, office hours, and review of most pull requests, reducing time to first contribution to 1 to 2 days.
- Designed Azure AD/JWT authentication using an internal single sign on token exchange for a Microsoft Teams integration, eliminating an entire proxy service and enabling direct access to REST/OData APIs from the embedded Teams application.

Software Engineer I

February 2020 – December 2021

- Initiated and architected the incident platform's React and microfrontend foundation, building the first React microfrontend and the reusable React/TypeScript infrastructure that later applications were built on, alongside the legacy AngularJS and Angular portal.
- Migrated two internal web platforms to Microsoft's standardized CI/CD system, eliminating self managed Linux build machines and establishing faster, compliant build pipelines.

Bloomberg L.P.
Software Engineer Intern

New York, NY
May 2019 – August 2019

- Migrated newsletter rendering from an external vendor to a TypeScript microfrontend container that dynamically rendered browser modules on Bloomberg.com.
- Built a TypeScript, Redis, and MySQL service to deliver compiled HTML, JavaScript, and CSS templates at up to 75,000 requests per second.

JPMorgan Chase & Co.
Software Engineer Intern

Chicago, IL
June 2018 – August 2018

- Architected an extensible Java and TypeScript test automation framework for a corporate banking payment platform, automating manual release validation. Served as Scrum Master for a team of 4 interns.

Object Edge
Software Engineer Intern

Walnut Creek, CA
May 2017 – August 2017

- Engineered a Java, Kafka, Redis, and Docker customer intent service handling 5,000 queries per second, and delivered React and GraphQL improvements that resolved 30% of known portal defects.

Education

Purdue University
Bachelor of Science in Computer Science, GPA: 3.79

West Lafayette, IN
December 2019
